This is the area that is the potentially most difficult/confusing. Experience indicates that:

1. You do not need to be a homeopath to use the information
2. You do not need to have/give the top remedies
3. It is best to spend a little time only on trying to make sense 5-10 minutes
4. It is useful to know really well the options for using the matrix information: there is great value in the methods available for finding patterns or themes- making groups of possibilities into probabilities.
5. If you can't make sense of the test information then do therapy on the client's presenting issue or focus from dialogue/ intuition/ questionnaire.
6. Don't try to go deep/ unravel the client first visit. We have layers and peel as onions when we are ready.
7. The first test dialogue is often the most informative.
8. Understand the background to specialist screens e.g. Allergy, homotoxicology etc. from the manual/ supplements before diving into them. Try to use facilities in context rather than isolation.
9. Have fun...be gentle with yourself and the client.

### What are the Test Scores

- An initial "Reactivity" at 1/100th second.
- Test scores are only possibilities
- Test scores just illustrate possible significance

## The Colours

The colour in the name column corresponds with the colour code buttons to the right: a test matrix item with yellow belongs to either Ayurvedic, Combination Remedies NV, Emotions etc.

## What are the Test Matrix Items

- The items are information. A letter is a carrier for information. A telephone is a carrier for information. ***The homeopathics in the test matrix are vehicles/ carriers for information: they have no other purpose!***
- A high value does not intrinsically mean that the item needs to be taken/ (avoided). It just means that it is possibly significant for the client.
- It is their associations that are most relevant: look for the words after the remedy.
- They may represent “solutions” rather than diagnosis (problem) hints. We are often focused on diagnosis: however our inner wisdom is interested in the moving forward options. Diagnosis is backward looking and relevant only for avoiding the error.

## The Colour Bands (Value Column)

Colour	Statistics	Meaning
Red	3 std devns	most significant -possibly Acute
Purple	2 std devns	significant
Yellow	1 std devns	
Blue	normal band	chronic may -hide here

*In statistics 2 or more standard deviations is significant*

### *No reds*

- Extremely healthy
- No energy to respond

## Reference Test Scores

Person Type	SOC	Test Score	No Reds	
<i>Theoretical</i>	1	all 50	0	Perfect health
<i>Ideal</i>	1		40-80	Perfect Health
<i>Well Child</i>	10	to 110-120	2-4	
<i>Unwell Child</i>	10	to 120-130	6-20	
<i>Healthy Adult</i>	30	to 110-130	4-6	

## SOC Influence on Test Scores

Person Type	SOC	Test Score	No Reds
Well Child	10	to 110-120	2-4
Unwell Child	10	to 120-130	6-20
Healthy Adult	30	to 110-130	4-6
Adult SOC	100	to 140-160	10-25
	200	to 180-200	20-40
	400	to 300-400	30-60

## Why does a score show as significant?

*It may lie anywhere in the client (energetic) field*

- Physical, mental, spiritual, emotional
- Be an aspect of a significant other
- Come from the past, present or be a future projection
  - *Was an issue in the past*
  - *Is an issue now*
  - *Never experienced it and wouldn't want to*

## The Individual Reaction Facility

This can be used at any time to check out further a specific item in the test matrix. The principle feedback information is reactivity and resonance. It is a 1 second energetic treatment of the item selected.

➤ *See Appendices for detailed interpretation.*

### *Reactivity*

- The client initial response in 1/100th second.
- a hint, a possibility.
- corroborate with 2 other “hints” to get to probability.

### *Resonance*

- a 1 second test.
- if high confirms that the item is probably ongoing significant.
- high resonance does not mean toxic or needed.
- other evidence is used to assess toxic or needed.

## Individual Reaction Value Interpretation

The table below illustrates possibilities.  
The values are not exact cut-offs.

*If Reactivity AND Resonance are both > 95 then the item is probably of ongoing significance.*

<b>Total React</b>	<b>Allergic React</b>	<b>Difference</b>	<b>Resonance</b>	<b>Interpretation</b>
>95	20	75	>95	Significant, not allergic
>95	20	75	<80	Not an ongoing issue
>95	70+	25	>95	Significant, allergic
>95	70+	25	<80	Possible allergen but not an ongoing issue
<80	low		>95	slow patient reactivity, possible toxic response

A coherence value of >95 is supportive of significance and may indicate a more system than local benefit. A better view may be in parallel with body communication. When information is really spot on then there will be a coherence effect: the cells will all take part. It is analogous to every "C" tuning fork in the world resonating when one "C" tuning fork is struck. When testing from the test tray the above also applies.

### **Rectified**

This is a measure of the degree of electronic stabilisation. Each item is tested by measuring the response to the homeopathic for that item. The item is tested as a wave form, which is characterised by variations in voltage, amperage and has a primary frequency and a set of harmonic frequencies (this is rather like a note from a musical instrument which will have a primary frequency and a whole set of harmonics of lower intensity).

Rectified means purely that the aberrant frequency of the item has been stabilised. This stability may last for a very short time, a medium time or totally correct the situation. How long the treatment holds for, as in any other modality, depends on the extent of the dysfunction and contributants to it. Many dysfunctions require a dripping tap approach: the body can only assimilate a certain amount of correction at any one time. It may need more correction. If it is a significant item in the patient's health then note it to check it again the next time round. Include monitoring of associated patient response in terms of symptoms etc.

If it is just a fleeting item that the patient has picked up today, then possibly just doing the individual reaction test, which is giving a very short energetic treatment, will correct it. An example is the correction of geopathic stresses within the calibration facility.

In the most general terms the time required i.e. the length of treatment, will directly relate to the cause of the dysfunction.
